

**Jong Sze Chin**  
*Singapore*

Dr Jong is a Rehabilitation Medicine Consultant at the National University Hospital, Alexandra Hospital and Ng Teng Fong General Hospital. She completed her Rehabilitation Medicine training in 2020. In addition to Rehabilitation Medicine, Dr Jong's other specialty interests includes cancer rehabilitation, sports medicine, and musculoskeletal related diseases. Currently, she is Vice Chair with the International Society of Physical and Rehabilitation Medicine (ISPRM) - World Youth Forum and a member of Singapore Cancer Society (SCS) Cancer Rehabilitation Management Committee.

**Topic: NeuroOncology Rehabilitation**

Despite significant treatment advancements that have led to improved survival rates and increased life expectancies for cancer survivors, functional impairment resulting from the disease or its treatment remains a critical issue. Studies consistently highlight worse health-related quality of life (QoL) in both physical and emotional aspects among cancer survivors compared to the general population. Additionally, cancer survivors are at higher risk of poorer clinical outcomes, increased morbidity, and mortality.

Cancer rehabilitation plays a pivotal role in the survivor-centric model of care for cancer patients. Its primary goal is to optimize patients' physical, social, physiological, and vocational functioning, enabling them to fully engage in daily activities and integrate into their communities. Remarkably, even among patients with poor prognoses, rehabilitation can help maintain a sense of self-governance and autonomy.
