

**Tan Zhi Chien Joshua**  
*Singapore*

Dr Joshua Tan is a medical oncology associate consultant at National Cancer Centre Singapore subspecializing in the treatment of breast and gynaecological cancers.

**Topic: How the Survival Prognosis of Spinal Metastases Patients has Changed? -  
Oncologist Point of View**

Spinal metastases represent a common oncological problem resulting in significant morbidity. Breast cancer, prostate cancer and lung cancer represent some of the cancers that most commonly metastasize to the bone. Advances in systemic therapy have resulted in a multitude of effective treatment options that can provide high rates of disease control that are durable and long lasting. This has allowed us to achieve control of spinal metastases, prevent complications, improve quality of life and prolong survival. Some of the commonly used effective systemic therapies that have allowed us to advance our management of patients with spinal metastases will be discussed in this talk.
